### **USC Course Development**

- **2021/2022:** Designed a new graduate-level class to provide students with foundational training as well as facility-specific training. Distinct from conventional nanofab courses, it covers the basics of cleanroom behavior (working in a clean environment, gowning, protocols for bringing materials into the cleanroom), general safety protocols (chemical, fumehood use, and protocols for hazardous materials commonly found in the facility), cleanroom operations, and chemical disposal protocols. While some of the training does

overlap with General Lab training, much of the information is specific to cleanroom operations, as a clean environment is unique.

- **2015:** In collaboration with Prof. Scott Fraser (Dornsife) and Prof. Andy McMahon (HSC, Stem Cell Institute), developed a course in which a team of undergraduates designed, built, and verified an optical projection tomography microscope, including machining, part sourcing and software development. This required developing the syllabus and course description from scratch, getting approval from UCOC as well as coordinating the dual-campus course. Additionally, for this group of students, I gained approval for this course to satisfy the ABET capstone requirement.
- **2011-2013:** Developed a Lab Component to MASC 350L: wrote proposal to purchase the necessary equipment/instrumentation for the undergraduate lab, and wrote the lab manual and developed protocols for six labs to accompany MASC 350. Labs were phased into the class, 2 per year, from 2011 through 2013.
